

I serbatoi (o compensatori) aria/olio vengono utilizzati principalmente per controllare la velocità dei cilindri pneumatici, realizzando un circuito oleopneumatico, come da schemi sotto riportati (1-2-3).

La regolazione della velocità del cilindro viene effettuata interponendo fra serbatoio (A) e cilindro (B) un regolatore di flusso unidirezionale (C) che regola il deflusso dell'olio, dal cilindro verso il serbatoio.

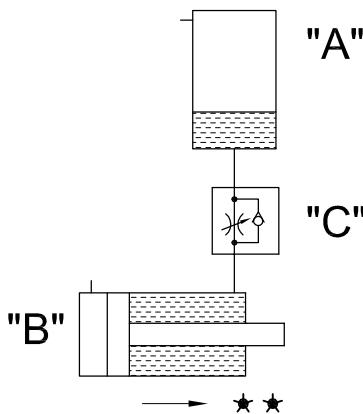

Il serbatoio aria/olio deve essere installato ad un livello superiore a quello del cilindro, e deve avere un volume utile superiore almeno del 20% rispetto al volume del cilindro.

The air / oil reservoirs are mainly used to control the speed of the pneumatic cylinders, realizing an air / oil circuit, as placed below diagrams (1-2-3).

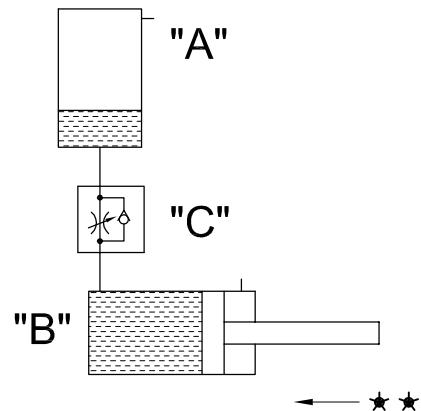

The control of the speed of the cylinder is obtained with an unidirectional flow regulator (C) placed between the air / oil reservoir (A) and the cylinder (B).

The air / oil reservoir must be placed at a higher level than the cylinder, and the useful volume of the air/oil reservoir must be at least the 20% greatest than the volume of the cylinder.
